OUTLINE
The RP500x Series are CMOS-based 600mA step-down DC/DC Converters with synchronous rectifier. Each of these ICs consists of an oscillator, a switching control circuit, a reference voltage unit, an error amplifier, a soft-start circuit, protection circuits, UVLO circuit, switching transistors, and so on. A low ripple, high efficiency step-down DC/DC converter can be easily composed of this IC with only an inductor and capacitors.

In terms of the output voltage, since the feedback resistances are built-in, the voltage is fixed internally. 0.1V step output can be set by laser-trim and 1.5% or 24mV tolerance depending on the output voltage is guaranteed. Mode alternative circuit works automatically for improving the efficiency. Considering fixed noise frequency, PWM fixed control type is also available.

As protection circuits, the current limit circuit which limits peak current of Lx at each clock cycle, and the latch type protection circuit which works if the term of the over-current condition keeps on a certain time exist. The latch-type protection circuit works to latch an internal driver with keeping it disable. To release the condition of the protection, after disabling this IC with a chip enable circuit, enable it again, or restart this IC with power-on or make the supply voltage at UVLO detector threshold level or lower than UVLO.

Since packages are WLCSP-6-P2, DFN1616-6, DFN(PLP)1820-6, SOT-23-6W, high density mounting on boards is possible.

FEATURES

- Supply Current ......................................................Typ. 400μA (at PWM mode)
  Typ. 100μA (at VFM mode)
- Standby Current ....................................................Max. 5μA
- Input Voltage Range .............................................2.55V to 5.50V
- Output Voltage Range ...........................................1.1V to 3.3V (0.1V steps)
  (For other voltages, please refer to MARK INFORMATIONS.)
- Output Voltage Accuracy ........................................±1.5% (V_{OUT}≥1.6V), ±24mV (V_{OUT}<1.6V)
- Temperature-Drift Coefficient of Output Voltage ..............................................................................Typ. ±100ppm/°C
- Oscillator Frequency .............................................Typ. 1.2MHz
- Oscillator Maximum Duty Cycle ................................Min. 100%
- Built-in Driver ON Resistance .................................Typ. Pch. 0.3Ω, Nch. 0.38Ω (V_{IN}=3.6V)
- UVLO Detector Threshold ........................................Typ. 2.2V
- Soft Start Time........................................................Typ. 120μs
- Lx Current Limit .....................................................Typ. 900mA
- Latch type Protection Circuit ..................................Typ. 1.5ms
- Two choices of Switching Mode............................Automatic PWM/VFM mode change / PWM fixed
- Packages ..............................................................WLCSP-6-P2, DFN1616-6, DFN(PLP)1820-6, SOT-23-6W

APPLICATIONS

- Power source for battery-powered equipment.
- Power source for hand-held communication equipment, cameras, VCRs, camcorders.
- Power source for HDD, portable equipment.
* RP500Z (WLCSP-6-P2) is the non-promotion product. As of March in 2014.

**RECOMMENDED OPERATING CONDITIONS** *(ELECTRICAL CHARACTERISTICS)*

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

TECHNICAL NOTES

When using these ICs, consider the following points:

- Set the same level as AGND and PGND.
- Set external components such as an inductor, C_{IN}, C_{OUT} as close as possible to the IC, in particular, minimize the wiring to V_{IN} pin and PGND pin. Reinforce the V_{IN}, PGND, and V_{OUT} lines sufficiently. Large switching current may flow in these lines. If the impedance of V_{IN} and PGND lines is too large, the internal voltage level in this IC may shift caused by the switching current, and the operation might be unstable. The wiring between V_{OUT} and load and between L and V_{OUT} should be separated.
- Use an external capacitor C_{IN} between V_{IN} and GND, and C_{OUT} with a capacity of 10\mu F or more ceramic type.
- Choose an inductor with inductance range from 4.7\mu H to 10\mu H. The phase compensation has been made by these values with output capacitors. The recommendation characteristics of the inductor are low DC resistance, large enough permissible current, and strong against the magnetic saturation. Inductance value may shift depending on an inductor. If the inductance value at an actual load current is low, L_{x} peak current may increase and may overlap the L_{x} current limit. As a result, over current protection may work.
- Over current protection circuit may be affected by self-heating and heat radiation environment.

* The performance of power source circuits using these ICs extremely depends upon the peripheral circuits. Pay attention in the selection of the peripheral circuits. In particular, design the peripheral circuits in a way that the values such as voltage, current, and power of each component, PCB patterns and the IC do not exceed their respected rated values. (such as the voltage, current, and power)
Operation of step-down DC/DC converter and Output Current

The DC/DC converter charges energy in the inductor when Lx transistor is ON, and discharges the energy from the inductor when Lx transistor is OFF and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. The operation will be explained with reference to the following diagrams:

- **Step 1**: Pch Tr. turns on and current IL (i1) flows, and energy is charged into CL. At this moment, IL increases from ILmin (=0) to reach ILmax in proportion to the on-time period (ton) of Pch Tr.
- **Step 2**: When Pch Tr. turns off, Synchronous rectifier Nch Tr. turns on in order that L maintains IL at ILmax, and current IL (i2) flows.
- **Step 3**: IL (i2) decreases gradually and reaches IL=ILmin=0 after a time period of topen, and Nch Tr. turns off. Provided that in the continuous mode, next cycle starts before IL becomes to 0 because toff time is not enough. In this case, IL value increases from this ILmin (>0).

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (ton), with the oscillator frequency (fosc) being maintained constant.

The maximum value (ILmax) and the minimum value (ILmin) of the current flowing through the inductor are the same as those when Pch Tr. turns on and off. The difference between ILmax and ILmin, which is represented by ΔI:

\[
\Delta I = IL_{max} - IL_{min} = V_{OUT} \times topen / L = (V_{IN} - V_{OUT}) \times ton / L \hspace{1cm} \text{Equation 1}
\]

wherein,

\[
T = 1 / fosc = ton + toff
\]

\[
duty \% = ton / T \times 100 = ton \times fosc \times 100
\]

\[
topen \leq toff
\]

In Equation 1, \( V_{OUT} \times topen / L \) and \( (V_{IN} - V_{OUT}) \times ton / L \) respectively show the change of the current at "ON", and the change of the current at "OFF".
Discontinuous mode and Continuous mode

When the output current ($I_{OUT}$) is relatively small, $t_{open} < t_{off}$ as illustrated in the following diagram. In this case, the energy is charged in the inductor during the time period of $t_{on}$ and is discharged in its entirely during the time period of $t_{off}$, therefore $I_{L_{min}}$ becomes to zero ($I_{L_{min}}=0$). When $I_{OUT}$ is gradually increased, eventually, $t_{open}$ becomes to $t_{off}$ ($t_{open}=t_{off}$), and when $I_{OUT}$ is further increased, $I_{L_{min}}$ becomes larger than zero ($I_{L_{min}}>0$). The former mode is referred to as the discontinuous mode and the latter mode is referred to as continuous mode.

![Diagrams showing Discontinuous and Continuous modes](image)

In the continuous mode, when Equation 1 is solved for $t_{on}$ and assumed that the solution is $t_{onc}$,

$$t_{onc} = \frac{T \times V_{OUT}}{V_{IN}}$$  \hspace{1cm} \text{Equation 2}

When $t_{on} < t_{onc}$, the mode is the discontinuous mode, and when $t_{on} = t_{onc}$, the mode is the continuous mode.

Output Current and selection of External components

The relation between the output current and external components is as follows:

When Pch Tr. of Lx is ON:

(Wherein, Ripple Current p-p value is described as $I_{RP}$, ON resistance of Pch Tr. and Nch Tr. of Lx are respectively described as $R_{ONP}$ and $R_{ONN}$, and the DC resistor of the inductor is described as $R_{L}$.)

$$V_{IN} = V_{OUT} + (R_{ONP} + R_{L}) \times I_{OUT} + L \times I_{RP} / t_{on}$$ \hspace{1cm} \text{Equation 3}

When Pch Tr. of Lx is "OFF" (Nch Tr. is "ON"):

$$L \times I_{RP} / t_{off} = R_{ONN} \times I_{OUT} + V_{OUT} + R_{L} \times I_{OUT}$$ \hspace{1cm} \text{Equation 4}

Put Equation 4 to Equation 3 and solve for ON duty of Pch transistor, $D_{ON} = t_{on} / (t_{off} + t_{on}),$

$$D_{ON} = (V_{OUT} + R_{ONN} \times I_{OUT} + R_{L} \times I_{OUT}) / (V_{IN} + R_{ONN} \times I_{OUT} - R_{ONP} \times I_{OUT})$$ \hspace{1cm} \text{Equation 5}
Ripple Current is as follows:

\[ IRP = (V_{IN} - V_{OUT} - R_{ONP} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / f_{osc} / L \] ..............................................Equation 6

wherein, peak current that flows through L, and LX Tr. is as follows:

\[ IL_{x\text{max}} = I_{OUT} + IRP / 2 \] .....................................................................................................Equation 7

Consider IL_{x\text{max}}, condition of input and output and select external components.

*The above explanation is directed to the calculation in an ideal case in continuous mode.
TIMING CHART

(1) Soft Start Time

• In the case of starting this IC with CE

In the case of starting this IC with CE, the operation can be as in the timing chart below. When the voltage of CE pin (V_{CE}) is beyond the threshold level, the operation of the IC starts. The threshold voltage of CE pin is in between CE "H" input voltage (V_{CEH}) and CE "L" input voltage (V_{CEL}) described in the electrical characteristics table. Soft-start circuit operates, and after the certain time, the reference voltage inside the IC (V_{REF}) is rising gradually up to the constant value.

- Soft-start time is the time interval from soft start circuit starting point to the reference voltage level reaching point up to this constant level.

- Soft start time is not always equal to the turn-on speed of DC/DC converter. The power supply capacity for this IC, load current, inductance and capacitance values affect the turn-on speed.

• In the case of starting with power supply

In the case of starting with power supply, when the input voltage (V_{IN}) is larger than UVLO released voltage (V_{UVLO2}), soft start circuit operates, and after that, the same explanation above is applied to the operation. Soft-start time is the time interval from soft start circuit starting point to the reference voltage level reaching point up to this constant level.

- Turn-on speed is affected by next conditions;
  (a) Input Voltage (V_{IN}) rising speed depending on the power supplier to the IC and input capacitor C_{IN}.
  (b) Output Capacitor C_{OUT} value and load current value.

\* RP500Z (WLCSP-6-P2) is the non-promotion product. As of March in 2014.
(2) Under Voltage Lockout (UVLO) Circuit

The step-down DC/DC converter stops and ON duty becomes 100%, if input voltage ($V_{IN}$) becomes less than the set output voltage ($V_{OUT}$), the output voltage ($V_{OUT}$) gradually drops according to the input voltage ($V_{IN}$). If the input voltage drops more and becomes less than UVLO detector threshold ($V_{UVLO1}$), the under voltage lockout circuit (UVLO) operates, the IC internal reference voltage ($V_{REF}$) stops, switching transistors turn off and the output voltage drops according to the load and output capacitor ($C_{OUT}$) value.

To restart the normal operation, the input voltage ($V_{IN}$) must be more than the UVLO released voltage ($V_{UVLO2}$).

The timing chart below describes the operation with varying the input voltage ($V_{IN}$).

*Actually, the waveform of $V_{OUT}$ at UVLO working and releasing varies depending on the initial voltage of $C_{OUT}$ and load current situation.
(3) Over Current Protection Circuit, Latch Type Protection Circuit

Over current protection circuit supervises the coil peak current (the current flowing Pch transistor) at each switching cycle, and if the current beyond the Lx current limit (I_{Lxlim}), Pch transistor is turned off. The Lx current limit of RP500x is Typ. 900mA.

Further, if the over current status continues equal or longer than protection delay time, or, when the Lx limit current is exceeded even once when the driver operates by duty 100%, a built-in driver is latched in the OFF state and the operation of DC/DC converter stops.

*Lx current limit and protection delay time is affected by self-heating and ambient environment. If the output is short and the input voltage (V_{IN}) is drastically dropped or becomes unstable, the protection operation and delay time may vary.

To release the condition of latch type protection, restart this IC by inputting "L" signal to CE pin, or restart this IC with power-on or make the supply voltage lower than UVLO detector threshold (V_{UVLO1}) level.

The timing chart shown below describes the changing process of input voltage rising, stable operating, operating with large current, reset with CE pin, stable operating, input voltage falling, input voltage recovering, and stable operating.

If too large current flows through the circuit because of short or other reasons, after the delay time of latch type protection a built-in driver is latched in the OFF state and V_{Lx} signal will be "L", then output will turn off. At the point (1), release the latch type protection is realized with CE reset as changed CE signal from "L" to "H".

At the point (2), release the latch type protection is realized with UVLO reset as make the supply voltage lower than UVLO detector threshold (V_{UVLO1}) level.

*RP500Z (WLCSP-6-P2) is the non-promotion product. As of March in 2014.*

**RP500x251A/253A**

[Graph showing efficiency vs. output current for RP500x251A/253A, with curves for different input voltages (VIN=3.6V and VIN=5V).]

**RP500x331A/333A**

[Graph showing efficiency vs. output current for RP500x331A/333A, with curves for different input voltages (VIN=4.3V and VIN=5V).]

**RP500x152A/154A**

[Graph showing efficiency vs. output current for RP500x152A/154A, with curves for different input voltages (VIN=3.6V and VIN=5V).]

**4) Supply Current 1, 2 vs. Temperature**

[Graph showing supply current vs. temperature for RP500x15xA, with curves for different input voltages (VIN=VCE=5.5V).]

**5) Supply Current 1, 2 vs. Input Voltage**

[Graph showing supply current vs. input voltage for RP500x15xA, with curves for different current levels (IDD1 and IDD2).]
6) DC/DC Output Waveform (C_{IN}=C_{OUT}=10 \mu F, L=4.7 \mu H)

*RP500Z (WLCSP-6-P2) is the non-promotion product. As of March in 2014.*
12) CE Input vs. Temperature

RP500x15xA

13) Lx Current Limit vs. Temperature

RP500x15xA

14) Nch Tr. ON Resistance vs. Temperature

RP500x15xA

15) Pch Tr. ON Resistance vs. Temperature

RP500x15xA

16) Turn on speed with CE pin (C\text{IN}=C\text{OUT}=\text{Ceramic 10}\mu\text{F}, L=4.7\mu\text{H})

RP500x111A/113A (I\text{OUT}=1.1mA)

RP500x251A/253A (I\text{OUT}=2.5mA)
RP500x331A/333A (I\text{OUT}=3.3\text{mA})

Output Voltage $V_{\text{OUT}}$ (V)

Output Current $I_{\text{OUT}}$ (mA)

CE Input Voltage $V_{\text{CE}}$ (V)

VIN=$5\text{V}$

VIN=$3.6\text{V}$

17) Load Transient Response ($C_{\text{IN}}=C_{\text{OUT}}=$ Ceramic 10\text{µF}, $L=4.7\text{µH}$)

RP500x121A/123A

Output Voltage $V_{\text{OUT}}$ (V)

Output Current $I_{\text{OUT}}$ (mA)

VIN=$3.6\text{V}$

Output Current $I_{\text{OUT}}$ (mA)

VIN=$3.6\text{V}$

RP500x12xA

Output Voltage $V_{\text{OUT}}$ (V)

Output Current $I_{\text{OUT}}$ (mA)

VIN=$3.6\text{V}$

Output Current $I_{\text{OUT}}$ (mA)

VIN=$3.6\text{V}$

RP500x152A/154A (I\text{OUT}=1.5\text{mA})

Output Voltage $V_{\text{OUT}}$ (V)

Output Current $I_{\text{OUT}}$ (mA)

VIN=$3.6\text{V}$

Output Current $I_{\text{OUT}}$ (mA)

VIN=$3.6\text{V}$

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.

2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.

3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.

4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party’s intellectual property rights or any other rights.

5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.

6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, firecontainment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.

7. Anti-radiation design is not implemented in the products described in this document.

8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh presented with the Japan Management Quality Award for 1999.

Ricoh continually strives to promote customer satisfaction, and shares the achievements of its management quality improvement program with people and society.

Ricoh awarded ISO 14001 certification.
The Ricoh Group was awarded ISO 14001 certification, which is an international standard for environmental management systems, at both its domestic and overseas production facilities. Our current aim is to obtain ISO 14001 certification for all of our business offices.

Ricoh completed the organization of the Lead-free production for all of our products. After Apr. 1, 2006, we will ship out the lead free products only. Thus, all products that will be shipped from now on comply with RoHS Directive.
