OUTLINE

The RS5RJ series are CMOS-based step-up DC/DC converter ICs equipped with a voltage regulator (VR) and a voltage detector (VD). Each of these step-up DC/DC converter ICs consists of a VFM DC/DC converter, a linear regulator and a voltage detector. These ICs are output-voltage-fixed type regulators which function as a linear regulator when input voltage is high, and as step-up DC/DC converter + linear regulator when input voltage is low, by using an inductor, a diode and a capacitor as external parts for the ICs.

Since a voltage detector is built in these ICs, the potentials such as the output voltage of DC/DC converters can be monitored.

In addition, these step-up DC/DC converter ICs are suitable for battery-powered and hand-held instruments because internal circuits can be turned off by the chip enable function so that the standby current can be minimized.

FEATURES

- Low Supply Current ...........................................Typ. 15µA (RS5RJ3624A : VIN=3.0V, at no load)
- Standby Mode .....................................................Istandby=Max. 1.0µA (RS5RJxxxxA)
  Istandby=Max. 10.0µA (RS5RJxxxxB)
- Low Voltage Operation Possible ........................Operating Voltage VIN=1.2V to 10V
- High Output Voltage Accuracy ............................Fixed Output Voltage Accuracy±2.5%
- High Detector Threshold Accuracy ........................±2.5%
- Output Voltage can be set at User’s request (refer to Selection Guide).
- Voltage close to battery’s voltage can be output because these ICs are of a step-up / step-down type (Ex. a fixed voltage of 3V can be output by a 3V battery).
- Built-in Protection Circuits for Lx Driver
- Pin for External Driver is equipped, and a large current output can be obtained.
- Small Package .....................................................8pin SOP

APPLICATIONS

- Power source for cameras, camcorders, and hand-held audio equipment.
- Power source for small OA apparatus such as note type personal computers, and word processors.
- Power source for hand-held communication appliances such as pagers, cordless telephones, and cellular phones.
**SELECTION GUIDE**

In the RS5RJ Series, the output voltage, the detector threshold, the version symbols, and the taping type for the ICs can be selected at the user’s request.

The selection can be made by designating the part number as shown below:

\[
\text{RS5RJxxxxx – xx} \leftarrow \text{Part Number}
\]

<table>
<thead>
<tr>
<th>Code</th>
<th>Contents</th>
</tr>
</thead>
</table>
| a    | Setting Output Voltage (VOUT):  
Stepwise setting with a step of 0.6V in the range of 1.5V to 6.0V is possible. |
| b    | Setting Detector Threshold Voltage (–VDET):  
Stepwise setting with a step of 0.1V in the range of 1.2V to 5.0V is possible. |
| c    | Designation of Version Symbols:  
A: Operation of all the internal circuits is stopped by setting CE pin at VDD level.  
B: Operation of only Step-up DC/DC converter is stopped by setting CE pin atVDD level. |
| d    | Designation of Taping Type:  
Ex. 8pin SOP : T1, T2  
(refer to Taping Specification)  
“T2” is prescribed as a standard. |

For example, the product with Output Voltage 5.0V, Detector Threshold 4.5V, Version A, and Taping Type T1, is designated by Part Number RS5RJ5045A-T1.

Absolute Maximum ratings are threshold limit values that must not be exceeded even for an instant under any conditions. Moreover, such values for any two items must not be reached simultaneously. Operation above these absolute maximum ratings may cause degradation or permanent damage to the device. These are stress ratings only and do not necessarily imply functional operation below these limits.

OPERATION OF STEP-UP DC/DC CONVERTER

Step-up DC/DC Converter charges energy in the inductor when Lx Transistor (LxTr) is ON, and discharges the energy with the addition of the energy from Input Power Source thereto when LxTr is off, so that a higher output voltage than the input voltage is obtained.

The operation will be explained with reference to the following diagrams:

Step.1 : LxTr is turned on and current IL (= i1 ) flows, so that energy is charged in L. At this moment, IL (= i1 ) is increased from ILmin (= 0) to reach ILmax in proportion to the on-time period (ton) of LxTr.

Step.2 : When LxTr is turned off, Schottky diode (SD) is turned on in order that L maintains IL at ILmax, so that current IL (= i2) is released.

Step.3 : IL (= i2) is gradually decreased, and in the case of discontinuous mode, IL reaches ILmin (= 0) after a time period of topen, so that SD is turned off.

In the case of the VFM control system, with the on-time period (ton) maintained constant, the output voltage is maintained constant by controlling the oscillator frequency (fosc).
OPERATION

1. **VDD Output Voltage**

VDD output voltage is shown in Fig. B.

   (1) In the case of \( V_{IN} - V_f \leq V_{DD0} \):
   
   In Area B, \( L_x Tr \) is maintained in an OFF state, so that \( V_{IN} - V_f \) (V) is output as it is from VDD pin without step-up operation.

   (2) In the case of \( V_{IN} - V_f < V_{DD0} \):
   
   In Area A, this IC functions as Step-up DC/DC converter. The step-up operation will now be explained with reference to FIG. A. The step-up operation is an operation for regulating the VDD output voltage by comparing Vref1 and the VDD output voltage by error amplifier circuits and subjecting \( L_x Tr \) to on-time control by VFM circuits (i.e., by controlling the step-up operation).

2. **VOUT Output Voltage**

A constant voltage is output from VOUT pin, with above-mentioned the VDD output voltage being subjected to a step-down operation by a linear regulator. This step-down operation will now be explained with reference to FIG. A. The step-down operation is an operation for regulating the VDD output voltage by Pch Tr by comparing Vref2 and the VDD output voltage.

\[
\begin{align*}
V_{IN} & : \text{Input Voltage} \\
V_{DD0} & : \text{VDD Set Voltage} \\
V_{OUT0} & : \text{VOUT Set Voltage} \\
V_f & : \text{ON Voltage of Diode}
\end{align*}

20) Efficiency vs. VDD Output Current

![Graph showing efficiency vs. VDD output current for RS5RJ5045A with output currents of 20mA, 40mA, and 60mA.](image)

(Note) Efficiency $\eta$ at Typical Characteristics 20) is shown by the following formula:

$$\eta = \frac{(V_{DD} \times IDDOUT) + (V_{OUT} \times IOUT)}{V_{IN} \times I_{IN}} \times 100$$
BASIC CIRCUIT

Examples of Parts:
- Inductor: RCR-664D (100µH) ; Sumida Electric Co., Ltd.
- Diode: MA721 (Schottky type) ; Matsushita Electronics Corporation
- Capacitor: 22µF (Tantalum type)
TYPICAL APPLICATIONS

• Current Boost Circuit 1

Examples of Components
- L: 47μH (SUMIDA ELECTRIC CD105)
- D: Schottky Diode (HITACHI HRP22)
- CIN: 220μF (Aluminum electrolytic Type)
- CVDD: 100μF (Tantalum type)/ 220μF (Aluminum electrolytic Type)
- COUT: 47μF (Tantalum Type)

Examples of Components
- CD: 0.01μF
- Cbe: 0.1μF (RS5RJ5045x, RS5RJ4036x, RS5RJ3624x)
- 100pF (RS5RJ3531x, RS5RJ3329x, RS5RJ3027x)
- NPN Tr: 2SD1628
- PNP Tr: 2SA1213
- Rb: 220Ω
- Rbe: 12Ω

• Current Boost Circuit 2 (High Efficiency Circuit)

Examples of Components
- L: 47μH (SUMIDA ELECTRIC CD105)
- D: Schottky Diode (HITACHI HRP22)
- CIN: 33μF (Tantalum type)/ 220μF (Aluminum electrolytic Type)
- CVDD: 33μF (Tantalum type)/ 220μF (Aluminum electrolytic Type)
- COUT: 47μF (Tantalum Type)

Examples of Components
- CD: 0.01μF
- NPN Tr: 2SD1628
- PNP Tr: 2SA1213
- Rb1: 220Ω
- Rb2: 330Ω
- Rbe: 10kΩ

(Note) High efficiency current boost circuit, using RS5RJ5045x with RNSRG50A (Ricoh Voltage Regulator).
When using these ICs, be sure to take care of the following points:

- Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, when an external component is connected to VOUT Pin, make minimum connection with the capacitor.

- Make sufficient grounding. A large current flows through Vss Pin by switching. When the impedance of the Vss connection is high, the potential within the IC is varied by the switching current. This may result in unstable operation of the IC.

- Use capacitor with a capacity of 10µF or more, and with good high frequency characteristics such as tantalum capacitor. We recommend the use of a capacitor with an allowable voltage which is at least three times the output set voltage. This is because there may be the case where a spike-shaped high voltage is generated by the inductor when Lx transistor is turned off.

- Take the utmost care when choosing an inductor. Namely, choose such an inductor that has sufficiently small d.c. resistance and large allowable current, and hardly reaches magnetic saturation. When the inductance value of the inductor is small, there may be the case where ILX exceeds the absolute maximum ratings at the maximum load. Use an inductor with an appropriate inductance.

- Use a diode of a Schottky type with high switching speed, and also take care of the rated current.

The performance of power source circuits using these ICs largely depends upon the peripheral components. Take the utmost care in the selection of the peripheral components. In particular, design the peripheral circuits in such a manner that the values such as voltage, current and power of each component, PCB patterns and the IC do not exceed their respective rated values.
1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.

2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.

3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.

4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh’s or any third party’s intellectual property rights or any other rights.

5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.

6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, firecontainment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.

7. Anti-radiation design is not implemented in the products described in this document.

8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

---

Ricoh awarded ISO 14001 certification.

Ricoh completed the organization of the Lead-free production for all of our products.

Ricoh presented with the Japan Management Quality Award for 1999.

Ricoh awarded ISO 14001 certification.

The Ricoh Group was awarded ISO 14001 certification, which is an international standard for environmental management systems, at both its domestic and overseas production facilities. Our current aim is to obtain ISO 14001 certification for all of our business offices.
